

(a) The chain and the attacker's target

Attacker's target: $Q(S_0, \text{Left}) > Q(S_0, \text{Right})$

(b) Two alternative reset rules

Start at the targeted state

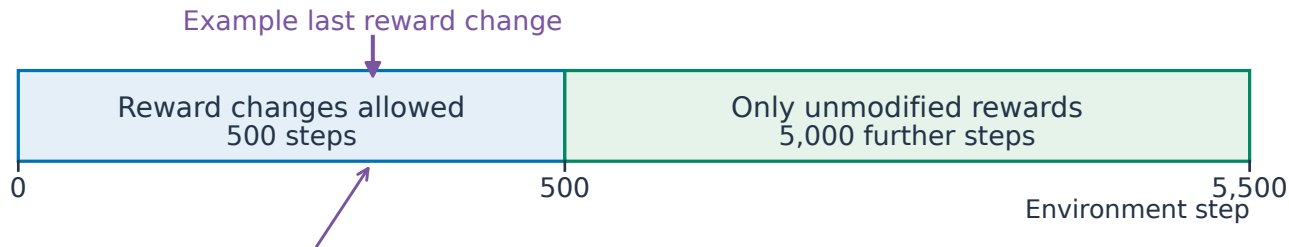

Start near the goal

A reset starts a new episode; it adds no future-value term to the terminal update.

(c) Allowed attack period and measurement clocks

Schematic timing, not to scale. The last change can precede step 500 without exhausting the budget.
