

(a) The chain and the attacker's target

Attacker's target: $Q(S0, \text{Left}) > Q(S0, \text{Right})$

(b) Two alternative reset rules

Start and reset at S0

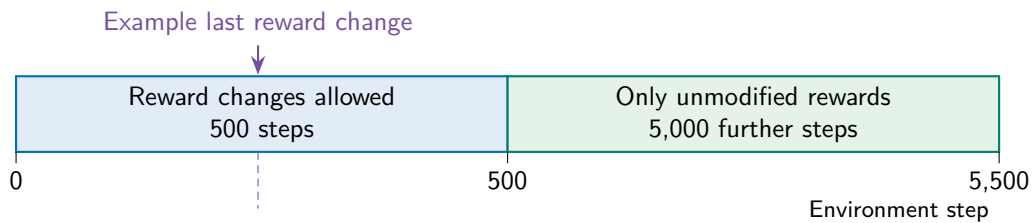

Start and reset at S2

A reset starts a new episode; it adds no future-value term to the terminal update.

(c) Allowed attack period and measurement clocks

Recovery is measured from immediately after the last changed-reward update.

Reward comparisons use the fixed periods: steps 1–500 and 501–5,500.

Schematic timing, not to scale. The last change can precede step 500 without exhausting the budget.
